# foreword

*Australian Fisheries Statistics* is designed to meet the needs of the fishing industry and fisheries managers, policy makers and researchers. ABARE has published detailed production and trade data in this series since 1991. The estimates of the gross value of production provided in the report are used for a range of purposes – for example, to determine Commonwealth, state and territory fisheries research funding arrangements each year.

This report contains data on the volume and value of production from state and Commonwealth fisheries, and on the volume and value of Australian fisheries trade, by destination, source and product, for the three years to 2005-06. The report also contains a profile of Commonwealth and state fisheries and state aquaculture for 2005-06, covering selected species, fishing method and number of licence holders.

*Australian Fisheries Statistics* is part of a suite of ABARE publications that provide a comprehensive account of historical trends in, and the outlook for, Australian fisheries. *Australian Commodity Statistics* provides a historical series of production and trade statistics for fisheries and a range of other commodities. *Australian Commodities* includes forecasts for major fisheries commodities that are updated each quarter. Detailed analysis of the economic performance of selected fisheries is provided in the annual *Australian Fisheries Surveys Report*.

Phillip Glyde

June 2007

# acknowledgments

Roslyn Wood, Alistair Peat and David Galeano prepared this report. Assistance from Matt Barwick of the Fisheries Research and Development Corporation is appreciated. The assistance of officers from state fisheries departments and the Australian Fisheries Management Authority, researchers and various industry representatives is gratefully acknowledged. The Australian Bureau of Statistics supplied the trade data.

Funding for this report was provided by the Fisheries Research and Development Corporation and the Australian Government Department of Agriculture, Fisheries and Forestry.

# enquiries

Inquiries on Commonwealth and state catch information should be directed to the respective coordinators of fisheries statistics shown below.

# definitions and explanations

## definitions

**Aquaculture production** is the liveweight quantity of product produced and marketed by aquaculturists.

**Aquaculture value** is the assessed value received by aquaculturists on the basis of an at 'farm gate' equivalent, for product marketed.

**Export quantity** data are supplied by the Australian Bureau of Statistics on the basis of the net product weight exported.

**Export value** data are supplied by the Australian Bureau of Statistics on the basis of free on board value.

**Import quantity** data are supplied by the Australian Bureau of Statistics on the basis of the net product weight imported.

**Import value** data are supplied by the Australian Bureau of Statistics on the basis of product cost plus insurance and freight.

**Production quantity** is a measure of the quantity of fish product landed by fishery, usually on the basis of catch records.

**Production value** is the assessed value at the point of landing for the quantity produced and excludes transport and marketing costs.

**Products** consist of fisheries products marketed for human consumption plus nonedible fisheries products.

**Seafood** is any fish or other aquatic plant or animal intended for human consumption; it excludes nonedible fisheries products.

## abbreviations and symbols

kg	kilogram
t	tonne
kt	kilotonne
\$	dollar (Australian)
\$'000	thousand dollars (Australian)
\$m	million dollars (Australian)

nei	not elsewhere included

## southern bluefin tuna

Southern bluefin tuna sold from aquaculture farms in South Australia is reported at its full market value. However, the input value of those tuna is also included as an output from the Commonwealth southern bluefin tuna fishery. To avoid double counting, the input value is netted out of Australian totals.

## 'reals' and rounding

'Real' 2005-06 dollars refers to the conversion of nominal dollar values to take account of inflation. Small discrepancies in totals are generally caused by the rounding components. A dash (-) is used to denote a nil or negligible amount.

# production and trade

## key features

roslyn wood

In 2005-06:

- » the volume of Australian fisheries production fell by 13 per cent to 241 000 tonnes, while the value of fisheries production increased by 1 per cent to \$2.13 billion
- » the value of Australian exports of fisheries products remained steady at \$1.5 billion
- » the value of Australian imports of fisheries products increased by 8 per cent to \$1.3 billion.

## overview

Production in Australia fisheries has recently been affected by unfavourable movements in a number of important macroeconomic variables. Fishing effort and catches have been influenced by cost increases, particularly fuel prices, which have reduced profit margins for operators. Many fisheries have also been affected by reductions in total allowable catches, changes to access arrangements and more restrictive input controls. The appreciation of the Australian dollar since 2002-03 has simultaneously made exports less competitive and imports more attractive to consumers.

In real terms (2005-06 dollars) the value of Australian fisheries production has been declining since 1999-2000 (figure A). In 2005-06, the gross value of fisheries production was \$2.13 billion, 25 per cent less than the real value in 1999-2000. Over the same period, the real value of Australian exports has declined by 36 per cent (figure B). Although the value of imports remained relatively unchanged, the quantity of edible imports increased by 35 per cent between 1999-2000 and 2005-06.

fig A real value of Australian fisheries production

fig B real value of Australian exports and imports of fisheries production

## production and trade

In value, Australia's major production species are rock lobster, prawns, abalone and tuna. Despite fluctuations in value (figure C), on average these four species account for more than half of Australia's gross value of production (55 per cent in 2005-06).

As a large proportion of Australia's rock lobster production is exported, prices are strongly influenced by market conditions and exchange rate movements in the major export destinations (Hong Kong, China and the United States). In particular, the strength of the Australian dollar and the outbreak of 'severe acute respiratory syndrome' (SARS) in 2003 had a significant effect on exports to Asia, with the average unit export price dropping 21 per cent between 2002-03 and 2003-04. Domestic prices fell accordingly and production value declined by \$66.6 million (in real terms) to a five year low of \$435 million. Prices for rock lobster have since improved, with production value increasing by \$35.7 million (in real terms) over the two years to 2005-06, despite a 19 per cent fall in production quantity. Contributing to this recovery was strong growth in export demand from China and the United States, which more than offset a decline in exports to Japan.

The real gross value of production of prawns has fallen by 42 per cent since 2000-01. This is the result of a 23 per cent fall in production quantity and a 24 per cent fall in average real prices. Local producers have faced competition from imported prawns, particularly from Viet Nam and China. Approximately 60 per cent of Australia's prawn production is sold on the domestic market, yet over the past decade the quantity of imported prawns more than doubled, while the price nearly halved. This has reduced the price that Australian buyers are willing to pay for domestic caught prawns.

Between 2000-01 and 2003-04 the gross value of production of abalone fell by 34 per cent (in real terms). This was the result of a 36 per cent fall in average real prices. As is the case with rock lobster, a large proportion of abalone is exported, mostly to Hong Kong, China and Japan. The appreciation of the Australian dollar and the outbreak of SARS in 2003 had a significant effect on abalone exports to Asia, with domestic and export prices dropping by 24 per cent and 30 per cent respectively (in real terms) between 2001-02 and 2003-04. The average unit price for abalone has since recovered, and as aquaculture operations continue to expand in Tasmania, Victoria and South Australia, new overseas markets are being explored.

fig C **real value of Australian production of major species**

After reaching a peak of \$377 million in 2000-01, the real value of tuna production in Australia more than halved over the following five years – falling by 54 per cent to \$175 million in 2005-06. Over this period, average unit prices fell by 41 per cent (in real terms), the effect of which was compounded by a 23 per cent fall in production quantity. Approximately 90 per cent of Australia's tuna production is exported, mostly to Japan. Prices have therefore been strongly affected by the appreciation of the Australian dollar against the Japanese yen, as well as increased competition from Mediterranean and Mexican farmed northern bluefin tuna.

## gross value of production – Australia [tables 1–17]

In 2005-06 the total volume of Australian fisheries production fell by 37 300 tonnes, or 13 per cent, to 241 000 tonnes. Production in the aquaculture sector rose by 7500 tonnes (16 per cent), while production in Commonwealth and state wildcatch fisheries fell by 9500 tonnes (13 per cent) and 35 200 tonnes (21 per cent) respectively.

Despite this decline, the total gross value of production increased by 1 per cent (\$27.6 million) to \$2.13 billion. This increase was the result of an 18 per cent (\$114 million) increase in the value of aquaculture production, which compensated for declining production values in the Commonwealth and state wildcatch sectors. The gross value of production in the Commonwealth sector fell from \$330 million to \$278 million (16 per cent), while the value of production from state wildcatch fisheries fell from \$1.18 billion to \$1.14 billion (3 per cent).

The increase in the gross value of production in the aquaculture sector was driven by higher unit prices for Tasmanian salmonids and an increase in South Australian southern bluefin tuna production. In the Commonwealth sector, the decline in gross value of production was largely the result of a lower production volume and, to a lesser extent, falling average unit prices. In the state wildcatch sector, the gross value of production fell proportionally less than volume because of a combination of factors, including changes in catch composition and unit price increases for several key species.

In 2005-06, rock lobster remained the highest value individual catch, followed by prawns, abalone and tuna (figure D). Prawns accounted for the highest individual catch, by volume (10 per cent), followed by rock lobster (7 per cent), oysters (5 per cent) and tuna (5 per cent).

fig D value of Australian production, by product

### box 1 exchange rates and unit prices

Australia is a small producer and exporter of fish onto the world market, so export prices received by Australian producers are generally set in world markets. Other things being equal, a depreciating Australian dollar results in higher export prices in Australian dollar terms, while an appreciating Australian dollar results in lower export prices.

In 2005-06, the Australia dollar continued to appreciate against the Japanese yen, increasing by 3.4 per cent, but depreciated against the US dollar, ending the year 3 per cent below the June 2005 quarter. These exchange rate shifts may partially explain changes in the unit value of fisheries products in 2005-06.

## production and trade

fig E **value of Australian fisheries products, by state, 2005-06**

where it was caught – Western Australia, Tasmania and South Australia accounted for 68 per cent of Australia's gross value of production.

Western Australia's share of gross value of production has declined significantly over the past decade, falling from 32 per cent in 1996-97 to 25 per cent in 2005-06 (figure F). This reflects the strong growth in aquaculture production in South Australia and Tasmania.

fig F **Australian fisheries production, by location**

## gross value of production – state and territory fisheries [tables 3–13]

The gross value of Australian fisheries production, by state and location of catch, is given in tables 3–6. In 2005-06, Western Australia had the largest gross value of production, accounting for 29 per cent of total state fisheries production (figure E). Tasmania had the second largest gross value of production (22 per cent), closely followed by South Australia (also 22 per cent).

By location of catch – where Commonwealth catch is distributed to the states according to

### New South Wales [table 7]

#### major species: oysters (aquaculture), prawns, abalone and sea mullet

The gross value of fisheries production in New South Wales fell by \$12.3 million to just under \$120 million in 2005-06. The gross value of production in the wildcatch sector fell from \$83.6 million in 2004-05 to \$74.6 million in 2005-06, the result of a fall in production levels for several key species. The value of king prawns fell for the second year in a row, from \$13.1 million (629 tonnes) in 2004-05 to \$10 million (483 tonnes) in 2005-06. The value of abalone and sea mullet also declined, from approximately \$8 million to \$5 million for both species (production fell by 31 per cent and 33 per cent respectively). The decline in the production of abalone reflected a reduction in the total allowable catch for the species.

In 2005-06 the gross value of aquaculture production fell from \$48.4 million to \$45.0 million, driven predominantly by a \$1.8 million (5 per cent) fall in the value of oyster production and a \$1.1 million (24 per cent) fall in the value of prawn production.

**Victoria** [table 8]**major species: abalone, rock lobster and trout (aquaculture)**

The total value of fisheries production in Victoria fell from \$109.8 million in 2004-05 to \$97.6 million in 2005-06. This decrease was mainly caused by a decrease in the value of wildcaught abalone from \$60.1 million to \$49.7 million, driven by an 18 per cent fall in production volume. Abalone continued to be the most valuable wildcaught species, however, accounting for 65 per cent of the total value of wildcaught production in 2005-06.

The value of aquaculture production also fell by 10 per cent, from \$23.9 million in 2004-05 to \$21.6 million in 2005-06.

**Queensland** [table 9]**major species: prawns, prawns (aquaculture), coral trout and crabs**

The gross value of fisheries production in Queensland fell from \$279 million in 2004-05 to \$257 million in 2005-06. This fall was caused by a reduction in the value of wildcaught production from \$214 million to \$190 million. In particular, declining production and prices in the wildcaught scallop sector resulted in a 49 per cent fall in the value in scallop production to \$8.1 million. Scallop catches are inherently variable because of environmental factors. Production in 2005-06 is also likely to have been affected by the rotational closure of several highly productive scallop grounds (DPIF 2006). Wildcaught production of crabs, prawns and finfish also fell in 2005-06, by \$6.8 million, \$4.8 million and \$3.8 million respectively. This was caused by a number of factors, including a reduction in the number of boats targeting these species, environmental factors and changes to management arrangements (DPIF 2006).

The gross value of aquaculture production rose by 3 per cent from \$64.5 million in 2004-05 to \$66.1 million in 2005-06.

**Western Australia** [table 10]**major species: rock lobster, pearls (aquaculture), prawns and abalone**

The gross value of fisheries production in Western Australia fell slightly in 2005-06, from \$543 million in 2004-05 to \$542 million. In the wildcaught sector, higher prices for rock lobster resulted in the gross value of production for the species rising by \$27.4 million (10 per cent) to \$292 million. However, the effect of this increase on total production value for Western Australia was largely offset by a \$14.3 million (61 per cent) fall in the value of scallop production, which dropped to \$9.3 million. This was the result of a 60 per cent fall in production volume, which was most likely the result of biological and/or environmental factors (Western Australian Department of Fisheries 2006).

The total value of aquaculture production remained relatively unchanged in 2005-06, at \$128 million.

## production and trade

### South Australia [table 11]

**major species: southern bluefin tuna (aquaculture), rock lobster, prawns, abalone and oysters (aquaculture)**

The gross value of fisheries production in South Australia rose by \$37.6 million to \$407 million in 2005-06. Despite a \$7.2 million decline in the production value of Australian sardines, the value of the wildcatch sector increased by \$9.7 million, largely through higher rock lobster prices driving production value up by \$15.1 million to \$81.2 million.

After falling by \$92.3 million in 2004-05, the value of aquaculture production rose again in 2005-06, by \$27.9 million to \$215 million, driven mainly by an increase in the value of southern bluefin tuna and oyster production.

The majority of southern bluefin tuna caught in Australia is captured by Commonwealth boats that net juvenile fish in the Great Australian Bight and tow them to aquaculture farms off Port Lincoln in South Australia for fattening. Almost 100 per cent of the farmed tuna is exported to Japan. In recent years, exchange rate movements and competition from farmed northern bluefin tuna in the Mediterranean and Mexico have reduced the price received by Australian producers in the Japanese market. The value of southern bluefin tuna from South Australia aquaculture farms fell from \$267 million in 2002-03 to \$140 million in 2004-05. The value of the industry production recovered slightly in 2005-06 (to \$156 million); however, given that prices continued to decline, the outcome reflected an increase in production from 7458 tonnes in 2004-05 to 8806 tonnes in 2005-06.

### Tasmania [table 12]

**major species: salmonids (aquaculture), abalone and rock lobster**

The gross value of production from Tasmanian fisheries rose by \$93 million to \$417 million in 2005-06. Although the volume of production from the wildcatch sector fell by 19 per cent, the gross value of production increased by \$3.2 million, reflecting an increase in the unit price of rock lobster.

A 57 per cent (\$89.8 million) increase in the value of aquaculture production in Tasmania was the principal contributor to the increase in gross value of fisheries production in 2005-06. The unit price of salmonids, which account for more than three-quarters of the value of Tasmanian aquaculture production, rose by 30 per cent in 2005-06. When combined with a 27 per cent increase in production, this resulted in an \$86.9 million increase in production value. The increase in the Tasmanian salmonid price was driven by higher world prices for salmon in 2005 and 2006. Contributing to this was stronger world demand for farmed salmon products.

### Northern Territory [table 13]

**major species: crabs, mackerel, gold band snapper and barramundi**

The gross value of fisheries production in the Northern Territory fell from \$57.6 million in 2004-05 to \$51.7 million in 2005-06. This was mainly caused by a 59 per cent drop in the unit price of shark, which resulted in a \$6 million fall in the value of wildcaught shark.

The value of aquaculture production rose by \$1.2 million in 2005-06 to \$26 million.

### gross value of production – Commonwealth fisheries [table 14]

The real value of production from Commonwealth fisheries has been falling since 2000-01 (figure G). In 2005-06, the value of production from Commonwealth fisheries fell a further 16 per cent to \$278 million. This decline was mainly to the result of a 13 per cent fall in the volume of production to around 63 000 tonnes.

The northern prawn fishery continued to be Australia's most valuable Commonwealth managed fishery in 2005-06. The gross value of production increased by nearly \$8 million to \$72.8 million, while the total volume of production increased by 5 per cent to 5400 tonnes.

Despite a fall in both the value and volume of production, the southern and eastern scalefish and shark fishery's Commonwealth trawl sector (formerly the south east trawl fishery) remained the next most valuable fishery, at \$43.6 million in 2005-06. The value and volume of production fell by 26 per cent and 20 per cent respectively. Contributing to the fall in production volume was the reduction in total allowable catches for several key species (for example, orange roughy and blue grenadier).

In the eastern tuna and billfish fishery the gross value of production fell from \$42.5 million in 2004-05 to \$28.7 million in 2005-06. This decline was largely the result of decreased catches of the major higher valued species (yellowfin tuna, bigeye tuna and billfish) and a shift toward lower cost and lower value species such as albacore.

In 2005-06, production also fell in most of the Commonwealth's other major fisheries, including the Torres Strait prawn fishery (9 per cent), the gillnet hook and trap sector (11 per cent) and Great Australian Bight sector (14 per cent) of the southern and eastern scalefish and shark fishery, the southern bluefin tuna fishery (4 per cent), the western tuna and billfish fishery (3 per cent) and the Bass Strait central zone scallop fishery (50 per cent). In many of these fisheries the effect of lower catch levels on gross value of production was compounded by declining unit prices for key species.

fig G **real value of Commonwealth fisheries production**

### gross value of production – aquaculture [tables 15-17]

After declining for several years, the gross value of Australian aquaculture production increased by 18 per cent in 2005-06 to \$748 million (figure H). This was driven by an increase in the value of finfish aquaculture, which rose from \$315 million in 2004-05 to \$451 million in 2005-06. In particular, a higher unit price resulted in the value of Tasmanian salmon production increasing by \$86.9 million (65 per cent) to \$221 million. Despite a small price drop, increased production also resulted in the value of South Australian southern bluefin tuna output increasing by \$15.8 million (11 per cent) to \$156 million.

## production and trade

fig H **real value of Australian aquaculture production**

fig I **aquaculture's share of total Australian fisheries production**

Aquaculture continues to be an important component of Australian fisheries production. Between 1996-97 and 2005-06, aquaculture's share of the total value of Australian fisheries production grew from 25 per cent to 35 per cent in (figure I).

Historically, salmonids (salmon and trout), tuna and pearl oysters have been the most valuable aquaculture species. In 2005-06 they accounted for 67 per cent of the gross value of aquaculture production (30 per cent, 21 per cent and 16 per cent respectively). In recent years, however, barramundi and abalone have also become valuable aquaculture industries. Between 2000-01 and 2005-06, production of barramundi more than doubled, increasing from 898 tonnes to 2075 tonnes. Over the same period, value increased by 77 per cent in real terms to \$17.2 million. The majority of this production is based in Queensland, although New South Wales has also increased its production capacity over the past five years. Similarly, aquacultural production of abalone continues to expand in Tasmania, Victoria and South Australia. In 2005-06 the combined value of production from these three states was worth nearly \$20 million.

fig J **value of Australian exports of fisheries products**

fig K **real value of Australian fisheries exports**

## *exports of fisheries products* [tables 18–28]

The total value of Australian exports of fishery products increased by \$5.3 million in 2005-06, to \$1.55 billion (table 18). Rock lobster remained Australia's most valuable fisheries export product, followed by pearls, abalone and tuna (figure J).

In real terms, the value of Australian exports fell by 38 per cent between 2000-01 and 2005-06 (figure K). The main factors contributing to this decline were a 19 per cent fall in the volume of edible exports and falling unit prices for major export species; in particular, rock lobster, prawns, abalone and tuna. The decline in unit prices is the result, in part, of a strong appreciation of the Australian dollar against the US dollar and the Japanese yen over this period.

### **export value, by commodity** [table 18]

In 2005-06, Australia's total exports of fisheries products were valued at \$1.55 billion. Approximately 80 per cent of this value was derived from edible fisheries products, such as finfish, crustaceans and molluscs. The remaining 20 per cent was from nonedible products, such as pearls, fish meal and marine fats and oils.

The most valuable edible fisheries export products in 2005-06 were rock lobster (\$489 million), abalone (\$246 million), tuna (\$177 million) and prawns (\$134 million) (table 18).

The value of nonedible exports rose by \$3.9 million to \$309.6 million in 2005-06. This was despite a \$1.5 million fall in the value of pearl exports, which accounted for 93 per cent of the value of nonedible exports.

### **value of exports of edible finfish** [table 19]

The export value of edible fish fell by 3 per cent in 2005-06 to \$295 million. This was mainly driven by a fall in the value of other whole fish (fresh, chilled or frozen) and dried, salted and smoked fish, which fell by 35 per cent and 32 per cent respectively.

Tuna dominates the export of finfish products, accounting for 61 per cent of export value in 2005-06 (table 19). In 2005-06, the value of tuna exports increased by \$13.7 million, or 8 per cent, to \$179 million. In particular, southern bluefin tuna exports increased from \$140 million in 2004-05 to \$156 million in 2005-06 (fresh and frozen exports rose by \$6.2 million and \$9.7 million respectively). This rise in value largely reflected a 442 tonnes increase in the quantity of fresh product exported and a 906 tonne increase in frozen exports.

After increasing by \$6.6 million to \$10.8 million in 2004-05, the value of salmon exports declined to \$8.1 million in 2005-06. These fluctuations were driven by changes in the value of exports to Japan.

### **value of exports of edible crustaceans and molluscs** [table 20]

The value of rock lobster exports, which accounted for more than half of the value of crustacean and mollusc exports, increased by 11 per cent to \$489 million in 2005-06. Live, fresh or chilled lobster exports rose by \$56.5 million. The effect of this increase on total crustacean and mollusc export value was, however, partly offset by a \$29.2 million decline in the value of prawn exports and a \$17.5 million fall in the value of abalone exports.

## production and trade

fig L **Australian exports of edible fisheries products, by destination**

## exports, by destination [tables 21-25]

### main export markets for edible fisheries products

In 2005-06 Hong Kong overtook Japan as Australia's main export market for edible fisheries products (figure L). In value, 33 per cent of edible fisheries products were exported to Hong Kong (\$396 million) and 31 per cent were exported to Japan (\$371 million) (table 24).

The main edible fisheries products exported to Hong Kong are rock lobster and abalone. In 2005-06, the total value of rock lobster exports to Hong Kong was \$228 million, up 54 per cent from \$149 million in 2004-05. The total value of abalone exports fell by 23 per cent to \$113 million.

Together these two species accounted for 76 per cent of seafood export volume to Hong Kong and 86 per cent of value (table 25).

The main products exported to Japan are tuna (whole), rock lobster, prawns and abalone – together these species accounted for 95 per cent of the value of edible exports to Japan in 2005-06. After falling by \$109 million in 2004-05, the export value of whole tuna rose slightly in 2005-06, from \$158 million to \$170 million. However, the export values of rock lobster, prawns and other fish fell over the same period, resulting in a total decline in exports to Japan from almost \$380 million in 2004-05 to \$371 million in 2005-06 (table 25).

Over the five years to 2005-06 the total value of seafood exports to Japan fell by 56 per cent in real terms, from \$839 million in 2000-01 to \$371 million in 2005-06. This was driven largely by substantial reductions in the export volume of key products (rock lobster, prawns and other fish) and the appreciation of the Australian dollar relative to the Japanese yen, the effects of which were compounded by declining yen prices for key export species, particularly prawns (figure M). For example, the yen price of prawns fell by around 28 per cent

between 2000-01 and 2005-06. In addition, the Australian dollar relative to the yen appreciated by 40 per cent over that period. These two factors resulted in the real price of prawn exports declining by 48 per cent over the period.

fig M **Japanese exchange rate and yen price of key export species to Japan**

Rock lobster is the main edible fisheries product exported to the United States, China and Chinese Taipei. In 2005-06 the export value of rock lobster to these countries was \$90.8 million (accounting for 80 per cent of Australian edible exports to the United States by value), \$45.5 million (44 per cent) and \$29.9 million (54 per cent) respectively (table 25).

The primary export market for Australian finfish products are Japan (tuna and salmon) and

Thailand (whiting). In 2005-06, Japan accounted for 96 per cent of the value of whole tuna exports (excluding canned) and 88 per cent of whole salmon exports (excluding canned). Over 60 per cent of the value of whole whiting exports were accounted for by Thailand. The majority of canned finfish exports went to New Zealand, which accounted for 69 per cent of the value of all canned tuna exports in 2005-06 and 90 per cent of all canned salmon exports (table 21).

Hong Kong and Japan continued to be the primary markets for Australia's exports of crustacean and mollusc products in 2005-06, valued at \$381 million and \$188 million respectively (tables 22-23). Together they accounted for 60 per cent of all Australian shellfish (comprised of crustaceans and molluscs) exports.

#### main export markets for nonedible fisheries products

The principal markets for nonedible fisheries products in 2005-06 were Hong Kong (\$150 million), Japan (\$63 million) and the United States (\$28 million). Other major markets for nonedible products included New Zealand, France and the United Kingdom (table 24).

#### exports, by state [tables 26-28]

In terms of value, South Australia and Queensland are the main exporters of finfish, while Western Australia and South Australia are the main exporters of crustaceans and molluscs. Of the total value of edible fisheries products exported in 2005-06, Western Australia provided 31 per cent, South Australia 26 per cent and Queensland 16 per cent (table 28).

### imports of fisheries products

[tables 29-38]

#### value of imports, by commodity

In 2005-06 the total value of Australian imports of fishery products increased by \$92.6 million or 8 per cent to \$1.26 billion. This value has been steadily rising over the past decade, with the value of imports in 2005-06 being nearly 43 per cent higher (in real terms) than in 1996-97 (figure N).

Edible fishery products, consisting of finfish, crustaceans and molluscs, accounted for 81 per cent (\$1.03 billion) of the gross value of imports. The remaining \$236 million of imports consisted of nonedible fisheries products such as pearls, fish meal and marine fats and oils.

fig N Australian imports of fisheries products

fig O Australian imports of edible fisheries products from selected countries excluding live

## production and trade

### edible fisheries imports [tables 29–31]

The total import value of edible fisheries products in 2005-06 increased by \$69.1 million to \$1.03 billion. This was driven mainly by higher unit values for canned fish and an increase in the volume of frozen fish fillet imports.

In 2005-06, 59 per cent (\$602 million) of the total value of imports of edible fisheries products were finfish products, while crustaceans and molluscs made up the remainder (\$426 million). The largest categories of edible finfish imports in value terms were frozen fish fillets (\$197 million, 33 per cent of edible finfish imports) and canned fish (\$229 million, 38 per cent). Crustacean and mollusc imports consisted mainly of prawns (\$256 million, including canned), followed by calamari, squid and octopus (\$63.2 million) and scallops (\$30.8 million).

### nonedible fisheries imports [table 29]

Nonedible fisheries products imported into Australia in 2005-06 consisted of pearls, fish meal, marine fats and oils, and ornamental fish. Pearls were the most valuable imports (\$159 million) followed by fish meal (\$22 million) and marine fats and oils (\$15.9 million).

fig P Australian imports of frozen prawns and finfish fillets from Viet Nam

fig Q Australian imports of frozen prawns, squid and scallops from China

### imports, by source [tables 32–37]

#### edible fisheries products

Thailand and New Zealand continue to dominate as the major source of edible fisheries products imported into Australia, together accounting for 42 per cent of total edible imports in 2005-06 (table 37). Imports from Thailand made up 26 per cent of edible products by value (\$270 million), followed by 16 per cent from New Zealand (\$160 million). However, imports from Viet Nam and China continued to rise, accounting for 13 per cent (\$133 million) and 10 per cent (\$101 million) respectively of the total value of edible imports in 2005-06.

Between 2000-01 and 2005-06 the value of edible fisheries imports from Viet Nam and China increased by 166 per cent (\$82.9 million) and 293 per cent (\$75.4 million) respectively (figure O). The main imported products from Viet Nam are frozen prawns (predominantly Vannamei prawns) valued at \$72.3 million in 2005-06 and frozen fish fillets (predominantly catfish) valued at \$42.4 million (figure P).

In 2005-06, the main products imported from China were frozen prawns (\$29.3 million)

– predominantly Vannamei prawns – squid (\$20.8 million) and scallops (\$16.2 million) (figure Q).

In 2005-06, nearly 63 per cent (\$143 million) of Australia's imports of canned fish and 20 per cent (\$7.3 million) of canned crustacean and mollusc imports were sourced from Thailand (tables 32, 36). New Zealand was the source of 34 per cent of Australian imports of fresh, chilled or frozen fish products (\$92.1 million – table 33), 24 per cent of fresh, chilled and frozen molluscs (\$24.6 million – table 36) and 32 per cent of canned crustaceans and mollusc imports (\$11.4 million – table 36). Nearly a quarter of dried and salted fish were imported from Norway (\$2 million – table 34), while Denmark was the source of 65 per cent of Australia's smoked fish imports (\$16.7 million – table 34).

#### **nonedible fisheries products** [table 37]

Australia's imports of nonedible fisheries products are sourced from a wide range of countries. In 2005-06, nearly 24 per cent of all nonedible fisheries products were sourced from four countries – the United States (\$18.7 million), Peru (\$15.8 million), Indonesia (\$11.8 million), and New Zealand (\$9.6 million).

## employment

Employment data for the Australian fishing industry is gathered from the population census survey conducted by the Australian Bureau of Statistics (ABS) every five years. As the results of the 2006 census are not yet available, the most recent ABS employment data (2001) for the Australian fishing industry are shown in table A.

The Fisheries Research and Development Corporation (FRDC) has stated that 'data collected by the Australian Bureau of Statistics is not disaggregated in sufficient detail to be very useful, and tends to underrecord employees by allocating them to other industries such as transport and generalised food processing' (FRDC 2004).

## B estimated employment in the Australian fishing industry *continued*

	number of employees	notes
<b>processing</b>		
New South Wales	125 FT 176 PT	In January 2005 ABARE carried out a survey of seafood processors across Australia. Of the 197 businesses found in the yellow pages, 52 were contacted and found to be ineligible (that is, not or no longer a seafood processor) and a further 36 businesses were unable to be contacted.
Victoria	82 FT 210 PT	
Queensland	113 FT 302 PT	
South Australia	165 FT 174 PT	
Western Australia	125 FT 627 PT	
Tasmania	176 FT 419 PT	
Northern Territory	na	There were no seafood processing businesses listed in the yellow pages for the Northern Territory.

FT = full time. PT = part time. Full time labor equivalent – for example, two people employed half time is equivalent to one person employed full time.

To provide additional information on employment, ABARE has collected data from its fishery surveys of the Commonwealth fisheries and from the states and the Northern Territory, where available. To obtain information on employment in the seafood processing sector, ABARE also carried out a survey of the sector in January 2005. This information is presented in table B. Note that the differences in definitions of employment between states and sectors mean that the total number of employees cannot be estimated.

### *recreational fishing*

Recently debate has increased on the allocation of fishery resources between various user groups, especially commercial and recreational fishers. The recreational fishing sector (charter and private recreational) in Australia is larger and more widely dispersed than in any other natural resource industry that supports a prominent commercial sector (FRDC 2004). The size and scope of the recreational sector makes it difficult to collect and aggregate data on catch and effort at the national level. Valuation of the recreational sector is even more difficult because, unlike the value of commercial fishing interests whose outputs are sold in markets, the value of recreational fishing is often not revealed through markets. For further information on economic valuation techniques and resource allocation, see Hundloe (2002) and Galeano et al. (2004).

Management of recreational fishing is the responsibility of the individual state and territory authorities and, as such, licensing requirements and regulations vary considerably depending on location, fishing method and species targeted.

## production and trade

In New South Wales a recreational fishing licence is required for all recreational fishing activities. Size and/or bag limits apply for many species, as do restrictions on the type of gear and fishing method that can be used. In Victoria an all-water recreational fishing licence was introduced in 1999; however, there are a number of categories entitling an exemption to holding a licence. In Western Australia, recreational fishing licences are required for abalone, rock lobster, marron, net fishing and freshwater angling. Size and bag limits also apply for the majority of species caught. A recreational fishing licence is necessary in Tasmania for inland fishing, and for the collection of abalone and rock lobster. Seasonal closures and area and gear restrictions are used for many of the larger recreational fisheries such as rock lobster,

## C available data on recreational fishing

state/territory	notes
<b>New South Wales</b> <a href="http://www.nsw.fish.gov.au">www.nsw.fish.gov.au</a>	<ul style="list-style-type: none"><li>• no comprehensive species by species value or catch data available</li><li>• logbook data containing information on catch and fishing effort – charter boats only</li><li>• various ad hoc economic impact and regional expenditures reports, either by species or region (for example, <i>Economic Impact of the Striped Marlin Fishery</i>)</li></ul>

<b>Queensland</b> <a href="http://www.dpi.qld.gov.au">www.dpi.qld.gov.au</a>	<ul style="list-style-type: none"><li>• no comprehensive species by species value data available</li><li>• catch and effort data available from the Coastal Habitat Resources Information System (CHRIS), an interactive website containing information on recreational species caught in Queensland</li></ul>
<b>Western Australia</b> <a href="http://www.fish.wa.gov.au">www.fish.wa.gov.au</a>	<ul style="list-style-type: none"><li>• no comprehensive species by species value or catch data available</li><li>• some information collected from charter boat / ecotour operators (for example, charter revenue in terms of total dollars spent on trips)</li><li>• estimates of catch rates and economic value generated by recreational fishing for some sectors published in Annual State of the Fisheries Report</li><li>• various ad hoc recreational fishing surveys (for example, a twelve month survey of recreational estuarine fishing in the South Coast bioregion of Western Australia during 2002-03)</li></ul>
<b>South Australia</b> <a href="http://www.pir.sa.gov.au">www.pir.sa.gov.au</a>	<ul style="list-style-type: none"><li>• no comprehensive species by species value or catch data available</li><li>• comprehensive survey of recreational fishing in South Australia undertaken in 1997</li></ul>
<b>Tasmania</b> <a href="http://www.dpiw.tas.gov.au">www.dpiw.tas.gov.au</a>	<ul style="list-style-type: none"><li>• no comprehensive species by species value or catch data available</li><li>• several surveys have been funded by fees from recreational licences, including assessments of the recreational rock lobster fishery, studies of net fishing and, most recently, a survey of game fishing in Tasmania</li></ul>
<b>Northern Territory</b> <a href="http://www.fisheries.nt.gov.au">www.fisheries.nt.gov.au</a>	<ul style="list-style-type: none"><li>• no comprehensive species by species value or catch data available</li><li>• broadscale surveys of recreational fishing activity in the Northern Territory was undertaken in 1995, 2000 and 2001</li><li>• the Amateur Fishermen's Association of the Northern Territory administers a series of programs through which catch and effort data are provided from several recreational fisheries</li><li>• catch and effort data also gathered during annual fishing tournaments.</li></ul>

giant crab, abalone and scallops. Queensland, South Australia and the Northern Territory do not require recreational fishing licences. However, Queensland and South Australia use effort controls such as size limits, gear restrictions and area closures to regulate recreational catch, while the Northern Territory has fish possession limits for a number of species.

The last consistent collection of data relating to recreational fishing was the National Recreational and Indigenous Fishing Survey which was commissioned in 2000-01 (Henry and Lyle 2003). Commonwealth and state agencies carried out the survey in the twelve months to May 2001. This survey used telephone and diary survey methods to estimate the number of recreational fishers in each state and the extent of their activities. Data collected included catch, fishing mode and location, and expenditure data at a state level.

A number of individual state/territory surveys have been undertaken on recreational fishing, based either on species or on individual fisheries/regions. However, because of the inconsistent nature of the data collected by the states, it is not possible to present up to date aggregated data on catch and value, by species and state. Details of information collected by states are contained in table C. Of particular note is Queensland, which has made available on their website an interactive database (the Coastal Habitat Resources Information System or CHRIS) containing information on recreational species caught in Queensland.

# profile of Australian fisheries in 2006

## Commonwealth <sup>a</sup>

fishery	main fishing area	species	method	number
northern prawn	Gulf of Carpentaria from Cape York to Cape Londonderry	banana, tiger, endeavour and king prawn	otter trawling	83 vessels

### Queensland

fishery	species	method	number
east coast trawl	tiger, banana, red spot king, endeavour, eastern king, 'bay' prawns, scallops, 'bugs' and trawl whiting	otter trawl	442 licence holders
river and estuary trawl	banana, 'bay' and tiger prawns	beam	144 licence holders
Gulf of Carpentaria inshore	barramundi, king and blue threadfin, tropical shark, grey mackerel	set (gill) net	87 licence holders
east coast net inshore (mainly tropical)	barramundi, king and blue threadfin, tropical shark, grey mackerel	set (gill) net	159 licence holders
east coast net inshore (mainly subtropical)	barramundi, king and blue threadfin, tropical shark, grey mackerel, mullet, tailor, bream, whiting	seine and some net	426 licence holders
line (handline)	coral trout, red throat emperor	handline	370 licence holders
line (trolling)	spanish, mackerel	trolling	256 licence holders
crab - estuary	mud and blue swimmer	pot	783 licence holders
crab - oceanic	spanner crabs		222 licence holders
aquaculture <sup>a</sup>	prawns	pond culture	61 licence holders
	barramundi	pond and cage culture	236 licence holders
	oysters	rack and stick culture	121 licence holders
	redclaw	ponds	317 licence holders
	silver perch	ponds and tanks	145 licence holders
	eels	ponds and tanks	39 licence holders
	barcoo grunter	ponds and tanks	121 licence holders

<sup>a</sup> Queensland's Department of Primary Industries and Fisheries is in the process of changing aquaculture approvals in Queensland from an aquaculture licence to a development approval. Some sectors have been finalised (prawns and oysters) while the balance are in the transition stage. The species listed as approvals includes both 'transitional aquaculture licences' and 'development approvals'. During this process, species may be added to permits due to a new species grouping arrangement for licensing. In the case of freshwater fish, this group includes thirteen species (including barramundi), and once finalised the number of approvals for this group will increase. A similar situation will occur for barcoo grunter and silver perch.
