Acknowledgments

Thuy Pham and Alistair Peat prepared this report. The assistance of officers from state fisheries departments and the Australian Fisheries Management Authority, researchers and various industry representatives is gratefully acknowledged. The Australian Bureau of Statistics supplies the trade data.

Funding for this report was provided by the Fisheries Research and Development Corporation and the Australian Government Department of Agriculture, Fisheries and Forestry.

Foreword

Australian fisheries statistics is designed to meet the needs of the fishing industry and fisheries managers, policy-makers and researchers. ABARE has published detailed production and trade data in this series since 1991. The estimates of the gross value of production provided in the report are used for a range of purposes such as determining Commonwealth, state and territory fisheries research funding arrangements each year.

This report contains data on the volume and value of production from state and Commonwealth fisheries. It also provides data on the volume and value of Australian fisheries trade by destination, source and product, for the three years to 2007-08. A profile of Commonwealth and state fisheries and state aquaculture for 2008, covering selected species, fishing method and number of licence holders is also covered.

Australian fisheries statistics is part of a suite of ABARE publications that provide a comprehensive account of historical trends in, and the outlook for, Australian fisheries. *Australian commodity statistics* provides a historical series of production and trade statistics for fisheries and a range of other commodities. *Australian commodities* includes forecasts for major fisheries commodities and is updated each quarter. Detailed analysis of the economic performance of selected fisheries is provided in the annual *Australian fisheries survey report*. An assessment of the economic performance of all fisheries managed by the Australian Fisheries Management Authority is provided in the joint ABARE and Bureau of Rural Sciences publication, *Fishery status reports*.

Phillip Glyde

Definitions and explanations

Aquaculture production is the liveweight quantity of product produced and marketed by aquaculturists.

Aquaculture value is the assessed value received by aquaculturists for product marketed on the basis of an at farm-gate equivalent.

Export quantity data are supplied by the Australian Bureau of Statistics on the basis of the net product weight exported.

Export value data are supplied by the Australian Bureau of Statistics on the basis of free on board value.

Import quantity data are supplied by the Australian Bureau of Statistics on the basis of the net product weight imported.

Import value data are supplied by the Australian Bureau of Statistics on the basis of product cost. The value excludes insurance and freight costs in delivering the commodity to Australia from the port of origin but may include inland freight and insurance costs incurred in delivering the commodity to the port of origin.

Production quantity is a measure of the quantity of fish product landed by fishery, which is usually on the basis of catch records.

Production value is the assessed value at the point of landing for the quantity produced and excludes transport and marketing costs.

Products consist of fisheries products marketed for human consumption plus non-edible fisheries products.

Real terms/real prices are historical or future prices adjusted to reflect changes to the purchasing power of money (most commonly measured by the consumer price index). Such prices may also be expressed as being in real terms.

‘Real’ 2007-08 dollars or ‘real terms’ refer to the conversion of nominal dollar values to take account of inflation. Comparison from year-to-year is expressed in nominal terms unless stated otherwise.

Rounding

Small discrepancies in totals are generally caused by the rounding components. A dash (-) is used to denote a nil or negligible amount.

Seafood is any fish or other aquatic plant or animal intended for human consumption; it excludes non-edible fisheries products.

Southern bluefin tuna

Southern bluefin tuna (SBT) sold from aquaculture ranches in South Australia is reported at its market value. However, the input value of tuna caught in the Commonwealth SBT fishery and grown out in aquaculture ranches is also included as a production output from the Commonwealth's southern bluefin tuna fishery. To avoid double counting, the input value is netted out of Australian totals.

Production

Fast facts

In 2007-08

- the total volume of Australian fisheries production fell by 3 per cent (7800 tonnes) to 236 000 tonnes;
- the gross value of production decreased by 1 per cent (\$24 million) to \$2.19 billion;
- of all the Commonwealth managed fisheries, the northern prawn fishery was the most valuable fishery in value terms, contributing \$74 million of the gross value of production, followed by the Commonwealth trawl sector (\$46 million) of the southern and eastern scalefish and shark fishery and the southern bluefin tuna fishery (\$45 million);
- Tasmania accounted for the largest share of gross value of production (22 per cent), followed by South Australia (21 per cent) and Western Australia (20 per cent).
- the gross value of aquaculture production increased by 8 per cent (\$62.7 million), to \$868 million, and accounted for 40 per cent of the gross value of Australian fisheries production (includes SBT wildcatch input to the South Australian tuna ranching sector). The volume of aquaculture production was 62 500 tonnes, accounting for 26 per cent of total Australian fisheries production, and;
- the gross value of production for the wildcatch sector decreased by 6 per cent (\$82.6 million) to \$1.3 billion, and accounted for 62 per cent of the gross value of Australian fisheries production. The volume of production was 178 400 tonnes, accounting for 76 per cent of the total Australian fisheries production.

Top five by volume

(wildcatch and aquaculture – tables 2 and 17)

Australian sardines	33 600 tonnes
Salmonids	25 500 tonnes
Prawns	22 400 tonnes
Tuna	14 700 tonnes
Rock lobster	13 800 tonnes

Top five by value

(wildcatch and aquaculture – tables 2 and 17)

Rock lobster	\$407 million
Salmonids	\$299 million
Prawns	\$268 million
Tuna	\$210 million
Abalone	\$189 million

Since 1998-99

- the total volume of fisheries production has increased by 2900 tonnes (1 per cent), while the real gross value of production has fallen by \$0.6 billion (22 per cent);
- the increase in production volume is the result of growth in the production of Australian sardines;
- the driving factor behind the fall in production value has been the decline in the value of rock lobster, prawns, abalone and tuna. The combined value of these four species has fallen by \$0.6 billion (in real terms) over this period, and;
- farmed salmonids from Tasmania have emerged as a key production species in terms of value, surpassing tuna as Australia’s most valuable finfish species group.

Production by species

The gross volume and value of Australian fisheries production, by species, is presented in tables 3-5. Production and value summaries are also presented in table 2 (wildcatch sector), tables 7-14 (individual jurisdictions) and tables 15-17 (aquaculture sector).

a Volume of Australian fisheries production

The volume of Australian fisheries production over the past decade has remained relatively stable, particularly for key species such as rock lobster and abalone (figure a). In 2007-08, the total volume of Australian fisheries production was 236 000 tonnes, approximately the same level as in 1998-99. Although production was relatively high during 2003-04 and 2004-05, averaging 278 000 tonnes over this period, Australian fisheries production volume averaged around 246 000 tonnes during the past decade.

In recent years, sardines (pilchards) have emerged as one of the major production species in Australian fisheries in volume terms. Sardines are used for feed in tuna ranching enterprises and are also being supplied to the recreational bait and pet food markets. Following the development of tuna ranching in the Port Lincoln region of South Australia, there has been an increase in demand for sardines. The production of the Australian sardine fishery rose by more than 700 per cent between 1999-2000 and 2004-05, from 5600 tonnes to 49 000 tonnes. In 2007-08, sardine production was about 33 600 tonnes, and accounted for 14 per cent of the Australian total volume

of fisheries production. As a low-valued species, changes in prices and the gross value of production of sardines have negligible effects on Australian gross value of fisheries production.

Farmed salmonids, comprising salmon and trout species, have also emerged as a key production species group in recent years, accounting for 11 per cent of total fisheries production in 2007-08. The increase in production of farmed salmonids, combined with higher unit prices, has resulted in a significant increase in this group’s value of production, which

Production

increased by 175 per cent (\$191 million) to \$300 million over the period 1998-99 to 2006-07 in real terms. In 2007-08, although the production volume remained stable, the value of salmonids production increased by 3 per cent as a result of an increase in the unit price of farmed salmonids (figure b).

However, the increase in the production value of salmonids has not been sufficient to offset the decline in the gross value of production of other key species. Over the period 1998-99 to 2007-08 the gross value of Australian fisheries production fell by 22 per cent (\$607 million) in real terms (figure c).

Driving this decline are reductions in the value of other key species, particularly rock lobster, prawns, abalone and tuna. The combined value of these four species, which typically account for at least half of Australia's gross value of fisheries production, has fallen by 53 per cent (\$571 million) in real terms since 1998-99

(figure b). This is largely the result of falling unit prices (figure d). Since the production of these species is export oriented, prices are strongly influenced by exchange rate movements. The strength of the Australian dollar against the currencies of major trading partners, particularly the US dollar and the Japanese yen, has reduced the competitiveness of Australian fisheries exports in recent years (box 1).

In 2007-08, rock lobster remained Australia's highest valued production species, valued at \$407 million, followed by salmonids (\$299 million), prawns (\$268 million), tuna (\$210 million) and

box 1 Exchange rates and unit value

Because Australia is a small producer and exporter of fisheries products, prices received by an Australian producer are generally set on world markets in foreign currencies. Other things being equal, a depreciating Australian dollar results in producers receiving a higher export price in Australian dollar terms, while an appreciating Australian dollar results in a lower export price.

In recent years, the strong appreciation of the Australian dollar has simultaneously made exports less competitive and imports more attractive to domestic consumers. In 2007-08, the Australian dollar continued to appreciate against the US dollar and the Japanese yen, rising by 14 per cent and 6 per cent, respectively (figure e). These exchange rate increases may partially explain the general trend towards lower unit value for export oriented fisheries products such as prawns, rock lobster and abalone in 2007-08.

e US-Australian and Yen-Australian exchange rates

f Value of Australian fisheries production, by product

Production

abalone (\$189 million) (figure f). Australian sardines accounted for the highest individual catch by volume (14 per cent), followed by salmonids (11 per cent), prawns (10 per cent), tuna (6 per cent) and rock lobster (6 per cent).

Rock lobster

Key jurisdictions: Western Australia (w), South Australia (w), Tasmania (w) and Victoria (w)

In 2007-08, rock lobster production increased by 2 per cent (285 tonnes) to 13 800 tonnes. Despite this increase in production volume, the gross value of rock lobster production in Australia fell by 8 per cent (\$36 million) to \$407 million as a result of lower unit prices, which fell by 9 per cent on average in Western Australia, South Australia and Victoria. Approximately two-thirds of Australia's rock lobster production is from Western Australia, where average catches are around 11 000 tonnes. However, in recent years, catch levels from the state have been lower than historical average at only 8961 tonnes in 2007-08. In 2007-08, the value of Western Australia's rock lobster production fell by 12 per cent (\$30 million) to \$217 million.

The majority of rock lobster production is exported. Major export markets include Hong Kong, Japan and the United States. Prices in overseas markets rose over the period 2003-04 to 2006-07 because of stronger demand and a reduction in supply from competing producers such as the United States. In 2007-08 beach prices fell by around 9 per cent because of the appreciation of the Australian dollar against the US dollar. Although domestic prices for rock lobster have recovered in recent years, they are still approximately 20 per cent lower in real terms than the peak in 2001-02 (figure d).

Salmonids

Key jurisdiction: Tasmania (a)

Since salmon farming started in 1998, salmonids production has increased significantly, with most of this growth occurring in the period 2002-03 to 2006-07. Farmed salmonids have become one of the key species of Australian fisheries production. More than 95 per cent of Australia's farmed salmonids production occurs in Tasmania.

Between 2002-03 and 2006-07, farmed Australian salmonids production rose by 66 per cent (10 200 tonnes) in volume and 121 per cent (\$164.6 million) in real value to reach 25 600 tonnes and \$300.6 million, respectively. In 2007-08 farmed salmonids production remained stable in terms of production volume.

Tasmania producers supply most of their salmonids to the domestic market. A key factor contributing to the rapid growth in recent years has been a strong focus on marketing salmon to Australian consumers. Another factor behind the sector's strong growth is the role of research and development, which has allowed the sector to adopt improved feeding techniques and apply better disease control measures.

Prawns

Key jurisdictions: Queensland (w, a), Commonwealth northern and Torres Strait prawn fisheries (w), Western Australia (w) and South Australia (w)

In 2007-08 Australian prawn production rose by 8 per cent (1600 tonnes) to 22 400 tonnes. This was largely the result of higher catches in the Commonwealth prawn fisheries, which increased by 28 per cent (1700 tonnes) compared with 2006-07. The gross value of Australian prawn production remained stable at \$268 million despite an 8 per cent decrease in average unit prices received by fishers. The volume of aquaculture prawn production was 3100 tonnes in 2007-08 and was valued at \$44.2 million. Over the past five years, aquaculture prawns accounted, on average, for around 14 per cent of the total volume of Australian prawn production.

Since 2000-01, the real value of prawn production has fallen by half in real value terms (\$286 million). Most of this decline is attributed to a fall in production volumes of 26 per cent (7700 tonnes) over the period to 2007-08, and to a lesser extent, also to lower unit prices, which declined by 35 per cent in real terms over the same period. In particular, production in two main prawn fisheries, the Northern Prawn fishery and the Queensland fishery, fell by 30 per cent (2900 tonnes) and 17 per cent (1600 tonnes), respectively, over this period.

One factor contributing to the decline in production was the appreciation of the Australian dollar, which resulted in local producers facing strong competition from imported prawns, particularly from Viet Nam and China. Over the 10 years to 2007-08, the quantity of imported prawns more than doubled, while average unit import prices (in real terms) nearly halved. The appreciation of the Australian dollar in recent years has reduced the price domestic producers receive for their product in export markets, placing pressure on the profitability of prawn operations. More recently, growth in prawn production has been moderated by the structural changes occurring in the northern prawn fishery, as a result of the Securing Our Fishing Future package, and higher fuel costs.

Abalone

Key jurisdictions: Tasmania (w, a), Victoria (w, a) and South Australia (w, a)

During the period 2000-01 to 2007-08, abalone average unit prices fell by 40 per cent in real terms. Average unit prices partially recovered in 2004-05 and 2005-06 before falling again in 2006-07 and 2007-08. Abalone production also decreased by 6 per cent (353 tonnes) during the period. The combined effect of declining production volumes and lower unit prices resulted in the real gross value of abalone production falling by 44 per cent (\$149 million) over this period. In 2007-08 Australian abalone production was 5300 tonnes, worth an estimated \$188.5 million.

A key driving factor of lower production volumes has been lower prices caused by the appreciation of the Australian exchange rate, changed management arrangements and adverse environmental conditions affecting production. A large proportion of abalone is exported, to Hong Kong, China and Japan. Therefore the appreciation of the Australian dollar from 2000-01 to 2007-08 had a significant effect on abalone exports, resulting in lower prices

Production

for producers. Furthermore, lower total allowable catch (TAC) settings and the outbreak of disease in Victorian wild stocks in recent years has reduced abalone wildcatch production in Australia, which declined by 14 per cent (799 tonnes) over this period.

However, increased production in the aquaculture sector in Victoria, Tasmania and South Australia has to some extent offset the decreased production in the wildcatch sector.

Tuna

Key jurisdictions: South Australia (a) and Commonwealth southern bluefin tuna and eastern tuna and billfish fishery (w)

The value of tuna production rose by 30 per cent (\$49 million) to \$210 million in 2007-08 after falling significantly in 2006-07. This was mainly the result of a 16 per cent increase in average unit prices in most of the tuna fisheries. This was despite the dampening effect on unit prices from the appreciation of the Australian dollar against the Japanese yen and a 30 per cent and 95 per cent increase in southern bluefin tuna and bigeye tuna production, respectively. Compared to 2006-07, the total volume of tuna production increased by 12 per cent (1600 tonnes) to 14 700 tonnes in 2007-08. The increases in southern bluefin tuna and bigeye tuna production offset decreases in the volume of yellowfin tuna and billfish production, which declined by 30 per cent (550 tonnes) to 1300 tonnes and 5 per cent (100 tonnes) to 1800 tonnes, respectively, in 2007-08.

g Real value of Australian tuna production

a Excludes the value of farm input from the Commonwealth's southern bluefin tuna industry.

Approximately 90 per cent of Australia's tuna production is exported, mostly to the Japanese sashimi market. Most of this tuna is produced in South Australia's aquaculture sector, which takes most of the Commonwealth southern bluefin tuna's output for fattening in purpose built tuna ranches.

The sharp rise in the value of production of tuna in 2007-08 follows a period of sharply lower production since 2000-01. After peaking at \$407 million in 2000-01, the real value of tuna production almost halved over the period to 2007-08 (figure g). Average unit prices fell by 42 per cent in real terms over this period, which was compounded by a 9 per cent fall in the volume of production.

In recent years, beach prices for tuna have been strongly influenced by export prices received from tuna exports to Japan. Besides the negative effect of the Australian dollar-Japanese yen exchange rate on domestic prices, Australian producers have also faced increased competition from Mediterranean and Mexican farmed northern bluefin tuna in the export market.

Production by jurisdiction

The gross volume and value of Australian fisheries production, by jurisdiction and location of catch, is given in tables 3–6. Production and value summaries for each jurisdiction are given in tables 7–14.

h Value of Australian fisheries products, by state, 2007-08

In 2007-08, Tasmania had the largest gross value of production (\$475 million), accounting for 22 per cent of total fisheries production, followed closely by South Australia (\$468 million, representing 21 per cent) and Western Australia (\$448 million, representing 20 per cent) (figure h).

By location of catch – where Commonwealth catch is distributed to the states according to where it was caught – Western Australia, Tasmania and South Australia accounted for 63 per cent of Australia’s gross value of production.

From 1997-98 to 2007-08 Western Australia’s share of gross value of production declined significantly, falling from 30 per cent in 1997-98 to 20 per cent in 2007-08 (figure i). Over the same period, Tasmania’s and South Australia’s share of total Australian fishery gross value of production increased significantly, reflecting the strong growth in aquaculture production in these states over this period. In 2007-08, aquaculture production in Tasmania was more than six times the production in 1997-98 (increasing by 24 000 tonnes), while South Australia’s production was more than double that of 1997-98 (increasing by 14 700 tonnes). Over the same period, the share of Commonwealth fisheries production fell from 19 per cent to 13 per cent in value terms.

i Australian fisheries production, by jurisdiction

Production

New South Wales [table 7](#)

Key species: oysters (a), prawns (w), sea mullet (w) and rock lobster (w)

In 2007-08, the gross value of fisheries production in New South Wales fell slightly, by 1 per cent (\$1.7 million) to \$130 million. This decline was driven by a significant decrease in production volume, which fell by 8 per cent to 19 800 tonnes. Most of the fall in production volumes and value occurred in the wildcatch sector, where production volume and value decreased by 11 per cent and 4 per cent, respectively. Contributing most to this decline were falls in production volume and unit value of particular species, especially sea mullet and breams. However, the effect of a decline in production value of key fish species was offset to some extent by increases in the production value of crustacean species, particularly rock lobsters and king prawns.

The gross value of aquaculture production in New South Wales increased by 5 per cent (\$2.1 million) to \$48 million in 2007-08. This was driven mostly by a \$2.6 million increase in the value of oyster production, which offset a decline of \$0.5 million in the value of farmed trout, silver perch and mussel production. Production remained relatively unchanged at 5200 tonnes in both 2006-07 and 2007-08.

Oysters, prawns and silver perch were the major contributors to the gross value of production of aquaculture in New South Wales. In 2007-08 these species accounted for 91 per cent of the state's gross value of aquaculture production. The remainder of aquaculture value of production came from barramundi, snapper, yabbies and trout.

Victoria [table 8](#)

Key species: abalone (w), rock lobster (w) and trout (a)

In 2007-08 the gross value of fisheries production in Victoria fell by 10 per cent (\$9 million) to \$86 million. This decline was mainly driven by the decline in the value of production for rock lobster and abalone, which fell by 11 per cent and 13 per cent respectively, as a result of lower production volumes in the case of rock lobster, and lower unit values in the case of abalone. Rock lobster production fell by 10 per cent, while unit value for abalone fell by 15 per cent. Volume and value of production of wildcatch crustaceans and molluscs also decreased considerably. In contrast, production of wildcatch fish species (especially Australian sardine, bream and King George whiting) increased by 14 per cent by volume and 15 per cent by value. Overall, there was a significant increase (12 per cent) in production volume in 2007-08, with most of this increase in catch coming from lower valued fish species.

The value of aquaculture production fell by 7 per cent, from \$19.9 million in 2006-07 to \$18.5 million in 2007-08. The fall in the gross value of aquaculture production was the result of a falling value of production for most of the cultured species, with the exception of ornamental fish and abalone. The value of salmonids production, the main aquaculture species, fell by 3 per cent to \$6.7 million as a result of a 17 per cent decrease in production. In contrast, the value of farmed abalone production rose significantly by \$1.6 million to \$6 million in 2007-08 as the result of an increase in abalone production by 45 tonnes.

Queensland [table 9](#)

Key species: prawns (w,a), coral trout (w), crabs (w) and barramundi (a)

In 2007-08, the gross value of fisheries production in Queensland remained stable at \$278.6 million but the production volume fell by 4 per cent to 29 000 tonnes. In the wildcatch sector, production value declined by \$3 million to \$203 million. However, this was offset by a \$3.4 million increase in the value of aquaculture production. The greatest fall in production volumes was for wild caught tiger and endeavour prawns, with their combined value falling by \$8.3 million. Offsetting these falls were rises in the production value of other prawn species, particularly king prawns (\$3.3 million) and the production value of coral trout (\$2.9 million). These increases were the result of higher production.

In 2007-08, the value of aquaculture production for most species decreased substantially. The value of production for prawns, the most valuable cultured species in Queensland, fell by 2 per cent (\$1 million) to \$41.5 million. The value of production for pearls and redclaw fell by 24 per cent each. However, this was offset by a significant 31 per cent (\$5.8 million) increase in barramundi production value, resulting in an increase in the gross value of aquaculture production by 5 per cent to \$75.5 million in 2007-08.

Western Australia [table 10](#)

Key species: rock lobster (w), pearls (a), prawns (w), scallop (w) and abalone (w)

The gross value of production in Western Australia fell by 7 per cent (\$33 million) to \$448 million in 2007-08 despite a 5 per cent increase in fisheries production volume. This decline was the result of a significant decrease in the value of production (mainly from weaker prices) of wild caught crustaceans, especially rock lobster and prawns. The unit value of rock lobster and prawns fell by 15 per cent and 5 per cent, respectively, between 2006-07 and 2007-08. As a result, the gross value of production of these species fell by 12 per cent and 6 per cent, respectively, in 2007-08.

The decline in the gross value of production in Western Australia also reflected a 5 per cent decline in the value of aquaculture production. This fall was the result of a significant decrease in the value of pearls, the most valuable cultured species in the state. The value of pearl production fell by 7 per cent from \$122 million in 2006-07 to \$113 million in 2007-08. However, the decline in the gross value of pearl production was offset by a significant increase in the gross value of other aquaculture species. In 2007-08, the gross value of other aquaculture production (excluding pearls) increased by 41 per cent (\$2.9 million) to \$9.8 million in 2007-08. This increase was driven mainly by the increase in both volume and value of cultured fish.

South Australia [table 11](#)

Key species: southern bluefin tuna (a), rock lobster (w), prawns (w), abalone (w) and oysters (a)

The gross value of fisheries production in South Australia rose by 10 per cent (\$41.6 million) to \$468 million in 2007-08. In the wildcatch sector, production decreased by \$12.7 million to \$206 million in 2007-08. This was largely attributable to the decline in the value of rock lobster and prawn production, which decreased by \$5.1 million and \$6.8 million, respectively. Lower unit values, especially for rock lobster and prawns, were the main driver of this fall. In 2007-08, the unit values of rock lobster and prawns declined by 2 per cent and 19 per cent, respectively.

The value of South Australian aquaculture production rose by 26 per cent (\$54.3 million) to \$262.2 million in 2007-08. The value of southern bluefin tuna production rose significantly by 36 per cent (\$49 million) to \$186.7 million. This largely offset a 20 per cent decrease in the value of oyster production as a result of a 29 per cent decrease in the volume of oyster production.

The observed increase in southern bluefin tuna aquaculture production in 2007-08 is the result of harvesting being carried out later than normal in the calendar year 2007. Therefore, the sale of the remaining tuna is recorded against the 2007-08 financial year. This accounts for the difference between the increase in production in the Commonwealth southern bluefin tuna fishery and the increase in tuna production in the South Australian aquaculture sector in 2007-08.

The majority of southern bluefin tuna caught in Australia is captured by Commonwealth endorsed boats that net juvenile fish in the Great Australian Bight and tow them to aquaculture farms off Port Lincoln in South Australia for fattening. Almost all of the farmed tuna is exported to Japan. In recent years, the strong appreciation of the Australian dollar against the Japanese yen by 6 per cent and competition from farmed northern bluefin tuna from the Mediterranean and Mexico have reduced the price received by Australian producers in the Japanese market. The real unit price of southern bluefin tuna from South Australian aquaculture farms has almost halved to \$19 a kilogram since 2000-01, with production value falling by \$135.3 million (in real terms) over the period 2000-01 to 2007-08.

Tasmania [table 12](#)

Key species: salmonids (a), abalone (w, a) and rock lobster (w)

The gross value of Tasmanian production was \$475.5 million in 2007-08, a decrease of 3 per cent from 2006-07. This decline was the result of a 15 per cent (\$27 million) decrease in the value of wildcatch production, which was compensated by a 4 per cent (\$12.4 million) increase in the value of aquaculture production.

In 2007-08, the production of the Tasmanian wildcatch sector was valued at \$156.7 million, a decrease of 15 per cent from 2006-07. Rock lobster and abalone accounted for 94 per cent of this value, contributing \$147 million. In 2007-08, the value of rock lobster production and abalone production fell by \$2 million and \$17 million, respectively, as a result of decreases in production volume. Wildcaught finfish also decreased by \$2 million.

In 2007-08 the value of Tasmanian aquaculture production was \$319 million, accounting for 67 per cent of the gross value of Tasmanian production. The most valuable species produced were salmonids, abalone and oysters. These species accounted for about 99 per cent (\$316 million) of the gross value of Tasmanian aquaculture production in 2007-08.

Northern Territory [table 13](#)

Key species: gold band snapper (w), crabs (w), barramundi (w) and mackerel (w)

The gross value of production in the Northern Territory was \$55.5 million and the catch was 5900 tonnes in 2007-08. The gross value of production increased by 4 per cent because of a significant increase in catch and average unit value of major species, especially gold band snapper. The value of gold band snapper catch increased by 80 per cent and value of production increased by 108 per cent in 2007-08. Other major species such as crabs and barramundi also experienced higher unit prices compared with the previous year.

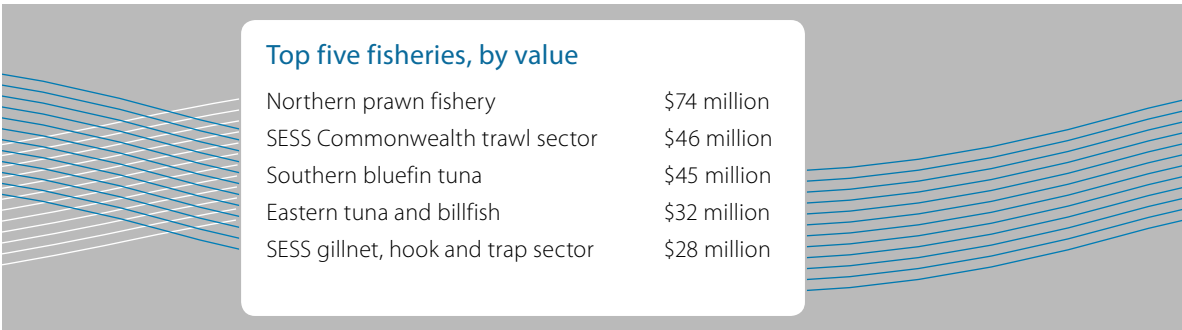

The gross value of aquaculture production fell by 8 per cent (\$2 million) to \$22.6 million in 2007-08.

Commonwealth [table 14](#)

Key species: prawns, tuna and sharks

In 2007-08, the gross value of Commonwealth fisheries production fell by 2 per cent to \$288 million, almost half the level of \$582 million in 2000-01 (figure j). Commonwealth fisheries production also declined significantly since 2000-01, falling by 28 per cent, from 72 300 tonnes in 2000-01 to 52 200 tonnes in 2007-08. The decline in production coincided with a period of lower beach prices, which on an average unit value basis, decreased by 31 per cent in real terms across all species from 2000-01 to 2007-08.

The northern prawn fishery remained the most valuable fishery in 2007-08, with a gross value of production of \$74 million. In 2007-08, the fishery experienced a 34 per cent increase in production and 16 per cent increase in the gross value of production. The strong growth in production is attributed to favourable seasonal conditions for banana prawns, which resulted in banana prawn production rising by 100 per cent (2700 tonnes) to 5300 tonnes. Despite a 2 per

Production

cent decrease in the average unit price, the value of banana prawn production increased by 95 per cent. In contrast, the tiger prawn catch and production value declined to one-third of the catch and value in 2006-07.

In 2007-08, the gross value of production in the Commonwealth trawl sector of the southern and eastern scalefish and shark fishery fell by 15 per cent to \$46 million and production fell by 7 per cent to 15 000 tonnes. Species caught in the sector mostly comprised of tiger flathead, ling, blue grenadier and spotted warehou. The largest falls in production were from blue grenadier and spotted warehou. The value of production of blue grenadier fell by 23 per cent to \$11 million. Spotted

warehou production was valued at \$3 million, a reduction of 31 per cent (\$1.4 million). Tiger flathead production increased by 14 per cent while the value of production fell slightly by 1 per cent. Prices decreased for most of the major species, resulting in an average 7 per cent decrease in unit value across all species in the sector.

The southern bluefin tuna fishery was the third most valuable of the Commonwealth managed fisheries in 2007-08. The fishery experienced an increase in gross value of production of 9 per cent to reach \$45 million in 2007-08.

In 2007-08, the gross value of production in the eastern tuna and billfish decreased by 2 per cent to \$32 million. The major species caught in the fishery remained yellowfin tuna, bigeye tuna and billfish, accounting for 86 per cent of the gross value of production of the fishery. In recent years there has been a significant increase in the share of albacore tuna in the gross value of production of the fishery. The total catch of albacore tuna during the period 2005-06 to 2007-08 was 5500 tonnes, which was equivalent to the volume of albacore tuna caught in the fishery in the 10 years prior to 2005-06.

The Commonwealth gillnet, hook and trap sector of the southern and eastern scalefish and shark fishery is a multi-species fishery, but the major species are sharks (mainly gummy and school shark), blue eye trevalla and ling. These species accounted for 88 per cent of the fishery's gross value of production in 2007-08. Shark catches (gummy and school) accounted for 69 per cent of the total gross value of production, followed by blue eye (11 per cent) and ling (8 per cent). The gross value of production of the Commonwealth gillnet, hook and trap fishery increased by 16 per cent (\$3.8 million) to \$27.5 million in 2007-08 as a result of a 13 per cent increase in production. The catch of gummy shark increased by 21 per cent and the gross value of production increased by 34 per cent. The catch of school shark increased by 48 per cent (124 tonnes) to 380 tonnes and the gross value of production increased by 36 per cent (\$600 000) despite an 8 per cent decrease in the unit price.

In 2007-08, prawns remained the most valuable species caught in the Commonwealth fisheries, with the gross value of prawn production rising by 13 per cent (\$9.6 million) to \$83.7 million. This increase was driven by a 26 per cent (1600 tonnes) increase in prawn production to 7900 tonnes in 2007-08, which offset the negative effect of an 11 per cent decrease in average unit price on the gross value of prawn production. The northern prawn fishery accounted for around 90 per cent of the Commonwealth prawn production in 2007-08.

The second most valuable species in 2007-08 was tuna. Although catch fell by 7 per cent compared with the previous year, the gross value of production increased by 5 per cent to \$67.2 million as a result of increased unit prices.

The value of shark production, the next most valuable species, was \$23 million in 2007-08. The gillnet, hook and trap sector and the Commonwealth trawl sector of the southern and eastern scalefish and shark fishery contributed 95 per cent of the total value of shark catches. The major catches were gummy sharks (\$18 million) and school sharks (\$2.3 million). The remainder was mainly from the Great Australian Bight sector of the southern and eastern scalefish and shark fishery.

Other valuable species landed from Commonwealth fisheries in 2007-08 included flathead (valued at \$17.8 million); blue grenadier (\$10.9 million); rock lobster (\$9.4 million); broadbill swordfish (\$7.8 million); and ling (\$6.5 million).

Production by sector

The gross volume and value of Australian production, by sector, is given in table 1. Production and value summaries for each sector are given in table 2 (wildcatch) and tables 15 to 17 (aquaculture).

k Real value of Australian fisheries production, by sector ^a

^a Excludes the value of farm input from the Commonwealth's southern bluefin tuna industry.

In 2007-08, the total volume of Australian fisheries production fell by 3 per cent (7800 tonnes) to 236 000 tonnes. This fall was driven by lower production in the Commonwealth and state wildcatch sectors, where production declined by 8 per cent (4600 tonnes) and 6 per cent (10 500 tonnes), respectively. This fall was partially offset by an increase of 4 per cent (2400 tonnes) in the production volume in the aquaculture sector.

Despite a large fall in production volume, the gross value of production fell by only 1 per cent (\$24 million) to \$2.19 billion (figure k). The gross value of aquaculture production rose by 8 per cent (\$62.7 million). Meanwhile the gross value of production of the Commonwealth wildcatch fisheries fell by 2 per cent.

Production

Aquaculture accounted for 40 per cent of the gross value of fisheries production in 2007-08, up from 29 per cent in 1998-99. Over the same period, the contribution of state fisheries to total wildcatch production value decreased from 55 per cent to 50 per cent. Commonwealth fisheries contribution to gross value of fisheries production steadily declined over this period from around 19 per cent in 1997-98 to 13 per cent in 2007-08.

Wildcatch [table 2](#)

Key species: prawns, rock lobster, tuna and abalone

In 2007-08, the total production volume of the wildcatch sector declined significantly, by 5 per cent (10 300 tonnes) to 178 000 tonnes. Most of this decline reflected falls in the production of fish and molluscs, by 7 per cent (9000 tonnes) and 14 per cent (3000 tonnes), respectively. Offsetting these declines was an increase in crustacean production of 5 per cent (1800 tonnes), driven largely by an 11 per cent (1900 tonnes) increase in prawn production.

As a result of lower production in 2007-08, the gross value of production of the wildcatch sector fell by 6 per cent (\$83.2 million) to \$1.3 billion. The value of finfish production fell by 3 per cent to \$431.8 million, being driven by lower unit values for Australian salmon, Australian sardine and flathead, as well as decreased production of tuna, Australian salmon and whiting. The value of mollusc production fell by \$30.4 million, driven largely by the fall in abalone production and unit value. The value of crustacean production fell by 38.4 million to \$696 million as a result of lower prices for prawns and rock lobster.

I Real gross value of Australian wildcatch fisheries production

Despite an 11 per cent (\$48.5 million) decrease in production value in 2007-08, rock lobster (\$407 million) remained the most valuable wildcatch species, followed by prawns (\$223 million). Rock lobster and prawns accounted for 30 per cent and 17 per cent of total value of wildcatch production, respectively. Other key species included abalone (\$172 million) and tuna (\$68 million).

During 2000-01 to 2007-08 the gross value of production of the wildcatch sector fell by 39 per cent (\$856 million) in real terms (figure I). This fall was a result of the decline in the value of production for all major wildcatch species such as rock lobster, prawns, tuna and abalone. In particular, the value of prawn and rock lobster production fell by \$270 million and \$183 million, respectively. The value of tuna and abalone production fell by \$84 million and \$162 million, respectively, over this period. These falls were the result of declining export unit prices, largely reflecting the strong appreciation of the Australian dollar against the currencies of major trading partners.

Aquaculture tables 15-17

Key species: prawns, oyster, tuna, salmonids

The gross value of aquaculture production continued to rise in 2007-08, by \$62.7 million to \$868 million (figure m). The value of finfish aquaculture rose by \$83.7 million to \$546.3 million. In particular, the value of tuna production increased by \$49.1 million, followed by barramundi (\$10.1 million) and salmonids (\$8.5 million). These species accounted for 95 per cent of the gross value of Australian aquaculture finfish production in 2007-08. The value of crustacean production fell by \$1.7 million as a result of declining prawn production. The value of mollusc production also fell by \$12.3 million, driven by an 8 per cent decrease in the production of pearl oysters.

m Real gross value of Australian aquaculture production

In 2007-08, the most valuable aquaculture species was farmed salmonids, accounting for 34 per cent of total production value and 41 per cent of total production volume. The emergence of farmed salmonids as a key species, in terms of aquaculture production and fisheries production overall, follows several years of rapid growth in Tasmania. During the period 2002-03 to 2007-08 the real value of farmed salmonids production more than doubled in real terms (increasing by \$163.3 million) to reach \$299.3 million in 2007-08.

The value of farmed tuna production in South Australia, the second most valuable aquaculture species, rose by \$49 million to \$186.7 million in 2007-08 with production increasing by 30 per cent (2300 tonnes) to 9800 tonnes. Higher prices also contributed to the increase in the value of production.

Trade

Fast facts - Exports

In 2007-08

- the total export value of fisheries products fell by 10 per cent to \$1.3 billion. A key driving factor behind this fall was a fall in the volume of production of edible fisheries products, and;
- approximately 80 per cent of export value was derived from edible fishery products such as fish and shellfish. The remainder was comprised of non-edible products, being predominantly pearls.

Since 2000-01

- the real value of Australian fisheries exports has fallen by \$1.3 billion (49 per cent);
- the driving factor behind this fall has been the decline in the value of key export species. The combined value of rock lobster, pearl, abalone, tuna and prawn exports has fallen by \$0.7 billion over this period, and;
- Hong Kong has overtaken Japan as Australia's main export destination for fisheries products.

Top five exports, by value

(edible and non-edible – table 18)

Rock lobster	\$401 million
Pearls	\$264 million
Abalone	\$217 million
Tuna (whole)	\$202 million
Prawns	\$69 million

Top five export destinations

(edible and non-edible – tables 24 and 25)

Hong Kong, China	\$554 million
Japan	\$382 million
United States	\$96 million
Chinese Taipei	\$45 million
Singapore	\$43 million

Fast facts - Imports

In 2007-08

- the value of Australian imports of fisheries products declined by 5 per cent to \$1.4 billion;
- this fall is attributed to a fall in imports of crustaceans and molluscs (by 14 per cent to \$417 million) and a fall in imports of non-edible fisheries products (by 6 per cent to \$266 million), and;
- approximately 80 per cent of import value was derived from edible fishery products. The remainder was comprised of non-edible products, being predominantly pearls and fishmeal.

Top five imports, by value

(edible and non-edible – table 29)

Canned fish	\$257 million
Frozen fish fillets	\$228 million
Fresh, chilled or frozen prawns	\$167 million
Pearls	\$166 million
Canned crustaceans and molluscs	\$128 million

Top five import sources

(edible and non-edible – tables 37 and 38)

Thailand	\$297 million
New Zealand	\$207 million
Viet Nam	\$142 million
China	\$133 million
Malaysia	\$56 million

Since 2003-04

- the real value of Australian fisheries imports has risen by \$153 million (12 per cent), being mostly driven by greater imports of fresh, chilled and frozen prawns and frozen fish fillets, and;
- the share of edible fishery imports from China and Viet Nam has risen, although Thailand and New Zealand remain Australia's main source of edible imports.

n Real value of Australian exports and imports of fisheries products

Exports and imports

Historically, Australia has been a net importer of fisheries products in volume terms but a net exporter in value terms. This disparity reflects the composition of Australian fisheries exports compared to imports. Australian fisheries exports are dominated by high value species such as rock lobster, tuna and abalone, while imports largely consist of lower value products such as frozen fish fillets, canned fish and frozen prawns. In recent years, the gap between imports and exports has closed. In 2007-08 Australia became a net importer of fisheries products in value terms (figure n).

The total value of Australian exports of fisheries products was \$1.3 billion in 2007-08. Nearly 80 per cent of this value was derived from edible fisheries products, such as fish, crustaceans and molluscs, which were valued at \$1.1 billion.

In real terms, the value of Australian fisheries exports has fallen by 49 per cent (\$1.3 billion) since 2000-01 (figure n). The main factors contributing to this decline are a 32 per cent decrease in the volume of edible exports and falling unit prices for major export species, particularly rock lobster, prawns, tuna and abalone. The decline in unit export prices is the result, in part, of a strong appreciation of the Australian dollar against the Japanese yen and US dollar over this period.

In real terms, the value of Australian fisheries imports has risen by 12 per cent (\$153 million) since 2003-04 (figure n). The main factors contributing to this increase are an 85 per cent increase in the quantity of canned crustacean and mollusc imports, and higher unit prices for whole fish and canned fish products.

O Real value of Australian fisheries exports, by commodity

Exports by commodity

The total export value of fisheries products (edible and non-edible) fell by 10 per cent in 2007-08 to \$1.3 billion (figure o). This fall was driven by a decrease in the volume of crustacean and mollusc product exports, which fell by 14 per cent in volume terms and 15 per cent in value terms to \$740 million, and a fall in the value of non-edible exports, by 18 per cent to \$276 million. The value of edible fish exports rose in 2007-08 by 16 per cent to \$325 million, being driven by a strong increase in the export value of whole tuna, which increased by 26 per cent to \$202 million.

The top five fisheries export products by value were rock lobster, pearls, abalone, tuna and prawns. Rock lobster remained the most important export species (\$401 million), followed by pearls (\$264 million), abalone (\$217 million), tuna (\$206 million) and prawns (\$69 million) (figure p).

p Value of Australian exports of fisheries products, by key species

Edible fisheries products

Key species: rock lobster, abalone, tuna and prawns

Finfish

The total export volume of edible finfish fell by 2 per cent, from 22 900 tonnes in 2006-07 to 22 400 tonnes in 2007-08. However, the value of finfish exports increased by 16 per cent to \$325 million in 2007-08, being driven by strong increases in the volume of exported whole frozen tuna and fresh or chilled salmon.

Tuna dominated edible finfish exports, accounting for about 56 per cent of the total export volume. In 2007-08, the volume of tuna exports was 12 600 tonnes, valued at \$206 million. Tuna exports rose by 8 per cent in volume terms and 27 per cent in value terms in 2007-08. The increase in export value and volume of whole frozen tuna was the main source of the increase in tuna exports, increasing by 39 per cent and 32 per cent, respectively.

In 2007-08 salmon exports (mostly comprised of fresh or chilled salmon and canned salmon) accounted for about 12 per cent and 6 per cent of the total finfish exports by volume and value, respectively. Export volume and value of this commodity increased significantly by 62 per cent and 57 per cent, respectively, in 2007-08. Fresh or chilled salmon exports increased by 62 per cent, accounting for 81 per cent of total salmon exports by value. Canned salmon exports, which contributed around 13 per cent of salmon exports in 2007-08, more than doubled in terms of quantity, to 472 tonnes, and nearly doubled in terms of value, to \$2.5 million.

Crustaceans and molluscs

The export value of crustaceans and molluscs decreased by 16 per cent in 2007-08 to \$741 million, with falls in export value being recorded for most species. The fall in export value for this category was matched by falls in the volume of exports, which fell by 14 per cent to 21 600 tonnes.

The major crustacean and mollusc exports are rock lobsters, prawns, crabs, abalone and scallops. Rock lobster accounted for 54 per cent of the total value of crustacean and mollusc exports in 2007-08 and the value of rock lobster exports declined by 13 per cent to \$401 million. The value of prawn exports also fell significantly in 2007-08, by 27 per cent to \$69 million because of a reduction of 37 per cent in whole prawn export volumes. Export earnings from abalone fell by 12 per cent to \$217 million in 2007-08 as a result of the declines in export volume of 8 per cent and prices of 4 per cent.

Non-edible fisheries products

Key products: pearls

The value of non-edible fisheries product exports fell by 18 per cent to \$276 million in 2007-08. Pearl exports, valued at \$264 million, were the most valuable non-edible export product, accounting for 96 per cent of the total non-edible export value and 20 per cent of the value of total fisheries product exports. The other important non-edible fisheries products were marine fats and oils, fish meal and ornamental fish, comprising 4 per cent of the total export value of non-edible fisheries products.

Exports by destination

Edible fisheries products

Key destinations: Hong Kong, Japan, United States

In 2007-08, Australia's major seafood export destinations were Hong Kong (\$426 million), Japan (\$328 million), the United States (\$72 million) and Chinese Taipei (\$45 million) (figure q). These countries accounted for about 85 per cent of the total Australian seafood exports in 2007-08.

q Australian exports of edible fisheries products (excluding live), by destination

In 2007-08, Hong Kong remained Australia's major export destination for edible fisheries products, accounting for 42 per cent of the total export value of edible fisheries products. Rock lobster and abalone were the main export species, accounting for 88 per cent of the total export value. However, exports of these species decreased by 3 per cent to \$372 million. Exports of scallops, dried, salted or smoked fish, crabs and prawns accounted for the remainder of total edible fisheries product exports to Hong Kong.

Japan accounted for 32 per cent of the total export value of edible fisheries products in 2007-08. The main edible fisheries products exported to Japan were tuna (whole), rock lobster, abalone and prawns which accounted for 95 per cent of the total edible export value. Whole tuna was the most important export species which contributed 60 per cent to the total export value.

Japan is Australia's most important tuna export market and accounted for 97 per cent of Australian exports of whole tuna by volume (excluding canned) in 2007-08. Japan is also a major market for salmon exports and accounted for 57 per cent of the whole salmon export volume (excluding canned) in the same period.

Other important export destinations include the United States, Chinese Taipei, Singapore and China. In 2007-08, rock lobster accounted for 84 per cent and 72 per cent of Australian seafood exported to the United States and Chinese Taipei, respectively. In 2007-08, Singapore became Australia's fifth most valuable export destination with a total export value of \$40 million. Exports of Australian edible fisheries products to China have decreased significantly over the past three years. Over the period 2005-06 to 2007-08, the volume and value of edible fisheries exports to China decreased by 61 per cent and 76 per cent, respectively.

The value of edible fish product exports to Japan increased by 7 per cent to \$328 million in 2007-08. Most of this increase was attributed to an increase in the export value of tuna of 31 per cent to \$196 million. The rise in export value in 2007-08 is in contrast to a decline in the value of seafood export to Japan between 2000-01 and 2006-07. Since 2000-01, the total value of seafood exports to Japan has fallen by more than half. This fall has been driven by substantial reductions in the export volume of major products (such as whole tuna, rock lobster and prawns) and the appreciation of the Australian dollar relative to the Japanese yen. In addition, weaker demand in the Japanese market has resulted in declines in prices for some key export species (especially rock lobster and prawns) (figure r).

In 2007-08, most finfish products were exported to Japan (tuna and salmon), New Zealand (canned fish), Thailand and China (whiting). Hong Kong and Japan remained the primary

Real export prices of key species to Japan

markets for Australian exports of crustaceans and molluscs. Export earnings from these markets for crustacean products were about 66 per cent of the total value of Australian crustacean exports and were valued at \$324 million.

Non-edible fisheries products

Key destinations: Hong Kong, Japan, United States

The major destinations of non-edible fisheries products were Hong Kong, Japan and the United States. Of the total non-edible export value, Hong Kong accounted for about 46 per cent (\$128 million) in 2007-08, Japan accounted for 19 per cent (\$53 million) and the United States accounted for 9 per cent (\$24 million). The major products exported to these markets were pearls. Pearls exported to Hong Kong, Japan and the United States accounted for about 99 per cent, 98 per cent and 87 per cent, respectively, of the value of these countries' total non-edible product imports from Australia.

Exports by states

South Australia, Western Australia, Queensland and Tasmania accounted for \$913 million (86 per cent) of the total export value of seafood products by state. South Australia remained the major exporter by value and accounted for around 32 per cent total fisheries exports (table 28). The most valuable export species from South Australia were fresh, chilled or frozen whole fish, followed by rock lobster. Western Australia was the main exporter of rock lobster, accounting for 57 per cent of the total export value of this species, and was the second largest state exporter of fisheries products. Queensland and Tasmania contributed to around 15 per cent and 14 per cent of total state export value, respectively.

Imports by commodity

The total value of Australian imports of fisheries products decreased by \$69 million (5 per cent) in 2007-08 to \$1.4 billion. Approximately 81 per cent of this value was derived from edible products (valued at \$1.1 billion), including finfish (51 per cent) and crustaceans and molluscs (30 per cent). The remaining 19 per cent comprised of non-edible products such as pearls, fish meal and marine fats and oils (figure 5).

Most of the decline in import value in 2007-08 was because of a substantial decline in the value of crustacean and mollusc imports, which fell 14 per cent (\$66 million) to \$417 million. The import value of non-edible fish products also fell, by around 6 per cent to \$266 million.

S Real value of Australian fisheries imports

The major imported products were canned fish (\$257 million), frozen fish fillets (\$228 million), fresh, chilled or frozen prawns (\$167 million) and pearls (\$166 million) (figure t).

Edible fisheries products

Key species: fish (canned, frozen fillets), prawns (fresh, chilled or frozen)

The total import value of edible fisheries products in 2007-08 decreased by 4 per cent (\$52 million) to \$1.1 billion. The largest fall in edible import value was from fresh, chilled or frozen prawn imports (which fell by 32 per cent) and smoked, dried or salted fish (which fell by

15 per cent). Offsetting these declines was the rise of imports in some other categories which comprise a substantial share of fishery product imports. For example, the imports of canned fish rose by 6 per cent to \$257 million.

t Value of Australian imports of fisheries products

In 2007-08, 63 per cent of the total value of imports of edible fisheries products (\$715 million) was from finfish, with crustaceans and molluscs comprising the remainder (\$417 million). The largest categories of edible finfish imports in value terms were canned fish (\$257 million) and frozen fish fillets (\$228 million). Crustacean and mollusc imports consisted mainly of prawns (\$250 million, including canned), followed by calamari, squid and octopus (\$46 million) and scallops (\$28 million).

Finfish

Finfish imports were valued at \$715 million and accounted for 63 per cent of the total edible imports in 2007-08. This value increased slightly (2 per cent) in 2007-08 because of the higher import value of fresh, chilled or frozen whole fish and canned fish. The value of fresh, chilled or frozen whole fish imports increased by 17 per cent to \$75 million. Canned fish imports increased by 6 per cent from \$244 million in 2006-07 to \$257 million in 2007-08. The import value of frozen fish fillets was stable at around \$228 million and accounted for 32 per cent of the total finfish imports in 2007-08. Canned tuna made up about 24 per cent of total value of finfish imports.

Frozen fish fillets and canned tuna together comprised about 60 per cent of the total finfish imports in volume terms which amounted to 82 000 tonnes. Canned salmon also contributed a large proportion to total finfish imports and accounted for 6 per cent of total finfish imports (8000 tonnes).

Crustaceans and molluscs

Crustacean and mollusc imports fell by 14 per cent in 2007-08 to \$417 million. That decline was mainly driven by a significant fall in fresh, chilled or frozen prawn imports, which decreased by 28 per cent to 19 000 tonnes. The fall in the import value of this category was larger (32 per cent) as a result of a decline in unit import values of around 6 per cent. However, the fall in import value was offset by a 25 per cent increase in the import value of canned and preserved crustacean and mollusc species to \$129 million. Most of the increase is because of an increase in the volume of canned and preserved prawn imports, which rose by 41 per cent to 11 000 tonnes. The value of canned and preserved prawn imports increased by 35 per cent to \$84 million in 2007-08.

Non-edible fisheries products

Key products: pearls, fish meal

The total import value of non-edible fisheries products decreased by 6 per cent to \$266 million in 2007-08. The major non-edible fish import products were pearls (63 per cent), fish meal (15 per cent) and marine fats and oils (10 per cent). A large part of this decline is attributed to an 8 per cent decrease in the value of pearl imports, which fell by \$15 million to \$166 million. This decline was offset by a 13 per cent increase in the value of marine fats and oils, which rose by around \$3 million to \$27 million, and by a 3 per cent increase in the import value of fish meal, which rose by \$1 million to \$41 million.

Imports by source

Edible fisheries products

Key sources: Thailand, New Zealand, Viet Nam, China

The major sources for Australian edible imports were Thailand, New Zealand, Viet Nam and China (figure u). Thailand remained the largest source by value (\$295 million),

U Value of Australian imports of edible fisheries products (excluding live), by source

accounting for 26 per cent of the total edible import value in 2007-08. New Zealand, Viet Nam and China accounted for about 18 per cent, 13 per cent and 12 per cent of the total edible import value, respectively.

The major import product from Thailand is canned fish, predominantly tuna which accounted for about 56 per cent of the total value of edible fisheries products imported from Thailand. The major import products from New Zealand were frozen fish fillets and fresh and chilled whole fish. In 2007-08, Australia imported \$63 million of frozen fish fillets and \$50 million of fresh and chilled whole fish from New Zealand.

The import value of edible fisheries products from Viet Nam and China has increased

sharply in recent years (figures v and w). The main commodities imported from these two countries have been prawns and canned crustaceans and molluscs which peaked at \$175 million in 2006-07. However, in 2007-08 the import value of prawns from these countries fell sharply, by 39 per cent, because of lower import volumes and prices. In 2007-08, Australia imported around \$90 million of prawns from Viet Nam and China, accounting for 36 per cent of the total value of prawn imports.

V Value of Australian imports of selected edible fisheries products from Viet Nam

W Value of Australian imports of selected edible fisheries products from China

Non-edible fisheries products

Key sources: Peru, the United States

In 2007-08 Australia imported \$266 million of non-edible fisheries products mainly from Peru and the United States with a combined value of \$62 million, accounting for 23 per cent of total non-edible imports. Non-edible imports from Peru mostly comprised of fish meal (mainly by Tasmania). Non-edible imports from the United States mostly comprised of other marine products (mainly by South Australia). Other major import sources were New Zealand and Indonesia, which contributed \$8.4 million and \$8.0 million, respectively.

Employment

The Australian Bureau of Statistics (ABS) reports two main series relating to commercial fishing employment. Estimates from the Labour Force Survey (part of the Monthly Population Survey) indicate that commercial fishing employment in 2007-08 was 13 000 persons, more than 30 per cent higher than in 2006-07, but around 32 per cent lower than in 2000-01 (figure x).

X Commercial fishing employment in Australia

Source: Australian Bureau of Statistics 2009.

Information collected from the 2006 ABS census provides further information on total employment in the fishing industry (table A). Of the 9700 people employed in the industry in 2006, more than one-third (3600 persons) were employed in aquaculture and more than 1100 persons were employed in rock lobster fishing, principally in Western Australia and South Australia. Tasmania has the largest share of aquaculture employment, while the fishing industries in Queensland, South Australia and Tasmania each employed around 1300 people. The affiliated industries of fish wholesaling and seafood processing employed 4200 and 2000 people, respectively.

Source: Australian Bureau of Statistics 2007.

Several points should be noted about the ABS employment data. Employment in commercial fishing covers Commonwealth fishing employment and state fisheries and aquaculture. Also, employment data do not give a strong indication of where the incomes of those employed in commercial fishing are spent.

The Fisheries Research and Development Corporation (FRDC) has stated that 'data collected by the Australian Bureau of Statistics is not disaggregated in sufficient detail to be useful, and tends to under record employees by allocating them to other industries such as transport and generalised food processing' (FRDC 2004). While it may be the case that those involved in transporting seafood are not strictly engaged in the commercial fishing industry, some of the categories behind the aggregate presented in figure x are likely to overlap.

Recreational and charter fishing

The management of recreational and charter fishing in Australia is the responsibility of the individual state and territory authorities. Licensing requirements and regulations vary considerably between jurisdictions and often depend on location, fishing method and the species being targeted. Recreational fishers do not have to report their activities to the fishery management agency.

In New South Wales a recreational fishing license is required for all recreational fishing activities. Size and bag limits apply for many species, as do gear restrictions and area/seasonal closures. Charter boat operators are also required to hold a license and maintain comprehensive catch records. However, there are a number of categories entitling an exemption to holding a license, with size and catch limits, and area and seasonal closure applying.

Fisheries Victoria stocks about 1.1 million native and salmonid fish per annum into Victorian public waters for recreational fishing purposes. An all-water recreational fishing license is required for activities in Victoria. However, size and catch limits, and area and seasonal closures also apply for a number of categories which entitle exemptions to holding a license.

In Western Australia, recreational fishing licenses are required for abalone, rock lobster, marron, net fishing and freshwater angling. Seasonal closures are used to moderate fishing effort, and size and bag limits also apply for the majority of species caught. Since 2001, operators in the aquatic tour industries, including charter fishing boats, are required to hold a license.

A recreational fishing license is necessary in Tasmania for inland freshwater fishing and for the collection of abalone, rock lobster and scallops. Gear restrictions and seasonal closures apply. Bag, size and possession limits and area restrictions apply for abalone, rock lobster, shellfish and scalefish.

Recreational fishers in Queensland, South Australia and the Northern Territory are not required to hold a license, although in the Northern Territory a permit is needed to enter aboriginal land and adjoining waters. Charter boat operators in South Australia and Queensland and commercial fishing guides in the Northern Territory are required to hold a license and must submit a logbook of their catch. Queensland and South Australia use effort controls such as size and bag limits, gear restrictions and seasonal and area closures to regulate catch. Additionally, in South Australia, the Fisheries Management Act 2007 requires the registration and personal use only of rock lobster pots, with limited maximum width and height. In the Northern Territory fish possession limits apply for a number of species.

The last consistent collection of data relating to recreational fishing was the National Recreational and Indigenous Fishing (NRIF) Survey in 2000-01 (Henry and Lyle eds. 2003). Commonwealth and state agencies carried out the survey over the 12 months to May 2001. This study used telephone and diary survey methods to estimate the number of recreational fishers in each state and territory and the extent of their activities. Data collected included catch, fishing mode and location, fishing effort and expenditure data at the state level.

A number of individual state/territory surveys have been undertaken on recreational fishing, based either on species or on individual fisheries/regions. However, because of the inconsistent nature of the data collected, it is not possible to present up-to-date national aggregations on catch and value, by species and state. Details of information collected by each state are summarised in table B. Queensland provides an online interactive database containing information on recreational species caught in Queensland (the Coastal Habitat Resources Information System or CHRIS).
